

Week 1

Monday, 10 March

I commenced the week—and my first day—with the general staff meeting, held monthly on the first Monday. The knowledge-sharing segment stood out, a colleague from my department presented on “Best Practices in Hardware Lifecycle Management.” The session was enriched with real-life examples from some of our prominent corporate clients. It was enlightening to observe how many of these practices align closely with Dell Technologies' standards, particularly as many of these companies prefer Dell Latitude laptops for their durability and suitability in demanding work environments. Following the meeting, I was warmly introduced to the engineering team, a senior technician guided me through the rest of the day. I spent the afternoon touring the engineering lab, where I was familiarized with the tools, devices, and ongoing projects within the department. From workstation imaging setups to component diagnostics, it was an exciting first look at the practical, fast-paced environment I'd be working in.

Wednesday, 12 March

The workshop was active throughout the day. I worked on diagnosing and repairing several client laptops from PWC, including one that only powered on when held at a certain angle—an issue caused by a loose internal connection, which I resolved. I also upgraded two Lenovo systems by installing additional RAM, noting the noticeable improvement in system performance. Later, I assisted in preparing refurbished Dell Latitude 5310 Laptops for sale, ensuring both the hardware and software were properly set up. Attention was given to details such as system cleanliness and default configurations, as these are often important to customers.

Friday, 14 March

I joined the delivery team delivering four server units to Interswitch's office at Victoria Island. Navigating the busy streets of Lekki and Victoria Island underscored the physical demands of hardware delivery — Lifting the servers to the storage rooms was very strenuous, requiring careful handling through narrow corridors to avoid damage. Each system had to be tested and confirmed operational before handover. Given Interswitch's strict security protocols, at the entrance, we were registered with the company for access and immediately an ID card was created and assigned to each of us. Every detail on the delivery and set-up checklist had to be thoroughly followed to ensure compliance and client satisfaction.

Week 2

Monday, 17 March

I focused on internal repairs throughout the day. A particularly challenging case involved a DELL Latitude 7420 with a persistent boot failure that resisted standard recovery tools. After collaborating with a senior engineer — my departmental supervisor, we traced the issue to a network driver conflict. In total, I diagnosed eight Dell Latitude 7420 units with various issues. I documented all findings in the diagnostic spreadsheet, placed an order for the necessary replacement parts, and am currently awaiting approval. The components are expected to arrive in-country and be delivered to the lab before the week ends.

Wednesday, 19 March

I was trusted to go alone to deliver and install multiple desktop systems at UBA headquarters, Marina. After which I went to return some laptops with issues resolved at a MultiChoice office. The day involved transporting full-sized desktop units through Lekki and Victoria Island, navigating tight schedules and heavy traffic. On-site, I handled the setup of each unit in professional office environments, ensuring proper configuration and readiness before client handover. Given the strict security procedures at both institutions, I followed all access and equipment verification protocols carefully. Every detail—from cabling to OS installation (Windows 11 pro.)—was double-checked to meet the clients' expectations.

Friday, 21 March

I diagnosed and repaired three Dell OptiPlex 3080 desktop units with overheating issues. This involved thoroughly cleaning internal dust buildup, reapplying thermal paste to CPUs, and running temperature stress tests to confirm thermal stability, some I had to replace faulty fans. Later in the day, I visited UPS Nigeria's office at Ikeja to troubleshoot a workstation experiencing frequent restarts. After diagnosing a faulty RAM module, I replaced it and monitored the system to ensure consistent performance. Additionally, I learned how to fix BIOS-related startup issues—including how to reset CMOS, update firmware, and restore default settings to resolve boot failures.

Week 3

Monday, 24 March

Assisted in the assembly of 8 HP EliteDesk 800 G5 desktops for Ernst & Young (EY) at their Marina office. Installed licensed Windows OS with product key activation, configured network settings by updating drivers, and ensured domain readiness. I encountered a driver detection issue during OS

installation, resolved it by switching the system configuration from RAID to AHCI mode in BIOS, which enabled proper driver loading and completion of the installation process. Also, I assisted a senior engineer during RAID configuration on a DELL PowerEdge server, gaining insight on storage optimization for enterprise systems.

Wednesday, 26 March

Diagnosed keyboard input failures on two DELL Latitude 7420 laptops during onsite support. I identified physical damage and replaced both keyboards to restore full functionality, followed by post-repair testing to confirm responsiveness across all keys. Conducted battery health assessments on refurbished laptops intended for resale, confirming all units maintained over 80% capacity and passed basic performance benchmarks. Additionally, I received a shipment for UPS Nigeria to our office, verified contents against the checklist, and ensured proper labeling, secure packing, and compliance with courier standards. Coordinated with the logistics team to schedule timely dispatch and documented the handover for tracking purposes.

Friday, 28 March

I accompanied the logistics team to deliver four DELL PowerEdge rack servers to Interswitch's data center. Provided onsite assistance during initial setup, including rack mounting, cable routing, and verifying power redundancy. Supported the configuration of dual-monitor setups for the design team's workstations connected to the servers, ensuring proper display resolution and ergonomic alignment. Later, I diagnosed a desktop experiencing random shutdowns and traced the issue to dust accumulation obstructing CPU fan airflow. Performed thorough internal cleaning and retested the system to confirm stable performance. Additionally, it contributed to reorganizing the engineering team's spare parts shelf by updating the labeling system for improved inventory tracking and accessibility.

Week 4

Monday, 31 March

I began the day participating in a morning strategy session to align on month-end service delivery targets. Alongside colleagues, I carried out BIOS updates, installed and activated Windows 11 Pro, and completed full system setup on a batch of 32 HP Tower desktop units allocated to UBA. For driver installations and system optimization, we used HP-specific utilities to ensure hardware compatibility and readiness for deployment. This hands-on engagement strengthened my familiarity with HP enterprise tools and reinforced best practices for scalable desktop provisioning in a corporate environment.
